INDEX DESCRIPTION:

The Index is composed of global listed real estate companies and REITs of the following regions: North America, Developed Europe, Japan and Developed Asia-Pacific ex Japan, with strong sustainability metrics, based on three sustainable investment considerations : Green building certification, Energy usage and Carbon Emission data, while aiming to comply with the Climate Transition Benchmark (CTB) targets of reducing carbon intensity by at least 30% relative to the initial investment universe and achieving an additional decarbonisation target of at least 7% each year, as defined in the framework of the European Benchmark Regulation. As a result, companies subject to significant violations of the UN Global Compact principles are excluded from the Index. The type of approach implemented here is thematic (the Index is composed of companies that provide products and services proving concrete solutions to specific environmental and/or social challenges, seeking to benefit from future growth anticipated in these areas while contributing capital to the transition towards a low-carbon, inclusive economy). The extra-financial strategy of the Index may comprise methodological limitations such as the risk related to ESG investment or the Index rebalancing. Further information on the index, its composition, calculation and rules for monitoring and periodic rebalancing, as well as information on the general methodology common to all FTSE Russell indices, can be found at www.ftserussell.com. Total ESG score

BNPP AM's internal ESG scoring methodology determines an issuer's ESG score by evaluating performance vs. scoring peers on a narrow set of key ESG issues related to the environment (e.g. climate change), social issues (e.g. human resources management) and governance (e.g. independence and competence of directors). BNPP AM uses numerous research inputs and data sources (e.g. Sustainalytics, ISS & Trucost) to determine issuers' ESG scores. If the issuer's commitments and practices on a pillar of assessment (E, S or G) is better than scoring peers, it will receive a positive 'contribution' for this pillar. Each issuer is assigned a final score from 1 to 99 which is the result of 50 as a reference plus the sum of the contributions from each of the three pillars.

ESG Contribution

The ESG contributions are determined by BNP Paribas Asset Management's ESG analysts on the basis of detailed criteria to systematically evaluate companies' commitments and practices in the areas of environmental, social and governance. Each of the above contributions at the portfolio level, is the weighted average of the contributions of the individual portfolio holdings. Environmental Contribution (E) takes into account, among other things, climate change, environmental risk management, and the use of natural resources. Social Contribution (S) takes into account, among other things, human capital management, the quality of social dialogue, and the respect of diversity. Governance Contribution (G) takes into account, among other things, the transparency on executive compensation, the fight against corruption, and gender equality.

Portfolio Coverage

The coverage represents, within an Index replicated by the fund, the percentage of securities that have an ESG score or carbon footprint using BNPP AM's internal methodology which can be lower than the full coverage offered per the index provider

MSCI ESG Fund Rating

The MSCI ESG rating is calculated as a direct mapping of ESG Quality Scores to letter rating categories (e.g. AAA = 8.6-10). The ESG Ratings range from leader (AAA/AA), average (A, BBB, BB) to laggard (B, CCC).

MSCI Weighted Average Carbon Intensity

It measures a fund's exposure to carbon intensive companies. This figure represents the estimated greenhouse gas emissions per \$1 million in sales across the fund's holdings. This allows for comparisons between funds of different sizes.

MSCI Weighted Average Carbon Intensity Coverage.

It is the percentage of the fund's holdings for which MSCI Carbon Intensity data is available. The MSCI Weighted Average Carbon Intensity metric is displayed for funds with any coverage. Funds with low coverage may not fully represent the fund's carbon characteristics given the lack of coverage.

MSCI ESG Quality Score (0-10)

The MSCI ESG Quality Score (0-10) for funds is calculated using the weighted average of the ESG scores of fund holdings. The Score also considers ESG rating trend of holdings and the fund exposure to holdings in the laggard category. MSCI rates underlying holdings according to their exposure to industry specific ESG risks and their ability to manage those risks relative to peers.

The summary risk indicator is a guide to the level of risk of this Product compared to other Products. It shows how likely it is that the Product will lose money

We have classified this Product as 4 out of 7, which is a medium risk class.

The risk category is justified by the investment mainly in stocks and shares, the value of which can fluctuate considerably. These fluctuations are often amplified in the short term.

Be aware of currency risk. If the currency of your account is different from the currency of this Product, the payments you will get depend on the exchange rate between the two currencies. This risk is not considered in the indicator shown above.

Other risks materially relevant to the Product not included in the summary risk indicator:

- **Operational risk:** in the event of an operational breakdown within the management company, one of its representatives or the depositary, investors could face various disruptions (late payment, delivery etc.).

For additional details regarding the risks, please refer to the prospectus.

This Product does not include any protection from future market performance so you could lose some or all of your investment.

GLOSSARY

Tracking Error

The tracking error measures the volatility of a portfolio's relative return in relation to its benchmark index.

Volatility

An asset's volatility is the standard deviation of its return. As a measure of dispersion, it evaluates the uncertainty of asset prices, which is often equated to their risk. Volatility can be calculated ex post (retrospectively) or estimated ex ante (anticipatively).
